

# Farm Payments and Peatlands Analysis Phase 2 Report (2023 Revision)

Keith Matthews, Dave Miller, Doug Wardell-Johnson, Gianna Gandossi James Hutton Institute Revised version 12 September, 2023

### Glossary

Acronyn	Full Text	Acronym	Full Text
AECS	Agri-Environment Climate Scheme	LMO	Land Managers Options
ВВ	Broadband	LPIS	Land Parcel Identification System
BEIS	(Department for) Business, Energy and Industrial Strategy	NECG	New Entrant Capital Grants
BES	Beef Efficiency Scheme	NESUG	New Entrant Start Up Grant
BPS	Basic Payment Scheme	P1	Pillar 1
BRN	Business Reference Number	P2	Pillar 2
CAGS	Crofting Agricultural Grant Scheme	PGRS	Permanent Grassland
CEH	Centre for Ecology and Hydrology	RPS	Rural Priorities Scheme
FGS	Forestry Grant Scheme	SAF	Single Application Form
FPMC	Food Processing, Marketing and Co-operation	SBCS	Scottish Beef Calf Scheme
FPS	Farmland Premium Scheme	SFGS	Small Farms Grant Scheme
FWPS	Farm Woodland Premium Scheme	SFPS	Single Farm Payment Scheme
FWS	Farm Woodland Scheme	SSBSS	Scottish Suckler Beef Support Scheme
IACS	Integrated Administration and Control System	SUSSS	Scottish Upland Sheep Support Scheme
JAC	June Agricultural Census	VCS	Voluntary Coupled Support
KTIF	Knowledge Transfer and Innovation Fund	YFSUG	Young Farmers Start Up Grant
LFASS	Less Favoured Area Support Scheme		

### Notes on the 2023 revised version

- The original Peatlands and Payments analysis (Phase 1) was undertaken in early 2021. This was an unpublished report for RESAS and SG policy teams. This used 2018 farm payments data and a version of the peatlands mapping that did not report the area of woodlands on peat.
- The Peatlands and Payments (Phase 2) analysis undertaken in early 2022 updated the payments to 2019 and added the woodland class, but the summary data focused only on the businesses >1000 ha. This was again an unpublished report for RESAS and SG policy teams.
- Following the 3 February 2023 ARIOB meeting where peatlands and future agriculture support were
  discussed, the materials from both Phase 1 and 2 analyses were reviewed and enhanced with the Phase
  1 reporting also updated to use the 2019 payments and improved peatland mapping.
- In May 2023 revisions to the Phase 2 reporting were undertaken with RESAS and RPID colleagues (this document).

### **Executive Summary**

### The characteristics of the 321 businesses with >1,000 ha of peat >50cm deep

- 1. They have 57% of all peatlands, ~1M ha of which 781k ha may need restoration and 275k ha is near natural bog which may still need measures to increase resilience to climate change. The areas of higher emissions conditions (crops and grasslands) are estimated at ~17k ha (though this estimate is likely to be revised) and the woodland area as ~37k ha.
- 2. There is a wide variety of tenures and tenure mixes present though with ownership is the dominant type (1.4M of 1.7M ha).
- 3. They have a Land Capability for Agriculture (LCA) mix dominated by classes with limited value for agriculture (LCA6+), 1.45M ha, with a significant part of this area being peatlands.
- 4. They have substantial values for agricultural standard outputs and employment, but it is likely that only a small part of that is generated in the uplands.
- 5. A mix of livestock types are present, larger numbers of sheep than cattle but there are questions here of which animals are present in the peatland areas and a holding level analysis would be helpful in that regard.
- 6. There is some degree of concentration in business types (e.g., specialist sheep 356k ha) and regions (e.g., Highland 700k ha, and Argyll & Bute 116k ha) but there are substantial areas of peatlands associated with a wide range of business types and a majority of regions, so some care is needed in any policy formulation to cope with the diversity of combinations.
- 7. A substantial area of the national parks have peatlands present (CNP 94k ha and LLT 29k ha).
- 8. Driven grouse enterprises are present ( $\sim$ 65k ha of burned land) but other sporting interests are unknown.
- 9. On-farm renewables are present on 53 of 321 businesses (as of 2016) with more likely to have interests via third parties.
- 10. The businesses have substantial CAP payments across both Pillar 1 (£25M) and Pillar 2 (£18.6M), noting especially forestry grants (£5.9M). The higher proportion of Pillar 2 activity compared with other businesses is also worth noting. The land is mostly BPS Region 3 land (783k ha) with Region 2 (higher stocked land) at 82k ha.
- 11. There are substantial areas that are either not linked to Direct Payments or have no, or null, agricultural activity (~650k ha) so that peatland restoration may not necessarily limit agricultural use.
- 12. They have been very active in Peatland Action funded restoration with ~17k ha out of the ~20k ha area of restoration undertaken on SIACS businesses since 2020.

### Background

### Introduction

- The Scottish Government are committed to restoring 250,000 hectares of peatland restoration by 2030, in order to meet the ambitious greenhouse gas emissions reductions, set out in the 2020 Climate Change Plan Update. To maximise the emissions reductions and associated co-benefits achieved as a result of peatland restoration, the Scottish Government are currently working with partners to consider the optimal mix of peatland types for restoration.
- Related to that work, the Scottish Government wish to improve their understanding of the location of different types of degraded peatland in relation to agricultural practices and agricultural support payments. This information will allow agriculture and peatland restoration policy decision makers to make more informed choices about the preferred areas for targeting peatland restoration offers.

### **Purpose**

The purpose of this project is to contribute to the evidence base on which policy decisions will be made by Ministers and supported by the Natural Resources Division and the Agriculture Policy Division.

### Scope

### **Aims**

The analysis sought to characterise the ~300 businesses with the largest extents of peatlands present within their land area.

This analysis built on:

- Datasets used in the Phase 1 Peatlands and Farm Payments analysis (completed in March 2021).
- The characterisations of Scotland's farming systems created for the 2014 versus 2019 farm support payments analysis for Agriculture and Rural Development stakeholders (December 2021).

### **Objectives**

The analysis aimed to:

- Refine the mapping of peatland categories. The analysis created a new revised version of the peatlands extent and characterisations mapping based on <u>Aitkenhead et al. (2021)</u>. This new version employed the National Forest Inventory 2019 mapping to improve the representation of woodlands.
- Respond to the request for business characterisation and mapping as specified by SG policy leads and RESAS analysts in the table of outputs (see next Slide).

## Table of expected outputs

Request	Method/Effort	Complete
Identify those businesses with >1000 ha of peatlands	Use all peatlands area and the area identified as in need of restoration. Present as visualisations of business counts vs. area.	Yes
For the ~300 businesses - what kind of businesses are they?	Repeat characterisations in Slide 23 of the Phase 1 Analysis – payments, standard outputs, livestock units, standard labour requirements.	Yes, incl. Option
Are they sporting estates?	<b>Option</b> - to add or extend the activity characterisations.  Use the burning and grouse butts data from Matthews et al (2020) as an indicator.	Yes
Are they in the national parks?	Calculate area per business within each of the two national parks.	Yes
Do they host renewable energy sources?	Use Farm Structure Survey to identify where renewables are part of the agricultural business - 2016. <b>Option</b> - Map based analysis for renewables.	Yes, not Option.
Do they have no agricultural activity?	Use IACS activity markers.	Yes
Where they are, geographically?	Map all business locations – national maps.	Yes
What is their capability for agriculture	Map extents with peatland condition and land capability for agriculture	Yes
Do all of them receive CAP support?	Per business payments breakdown by Pillar and Scheme.	Yes
Are they in receipt of forestry grants?	Per business current and legacy forestry payments (subset of above).	Yes
Have any undergone peatland restoration?	Per business any payments for peatland related work in Pillar 2 (potentially at measure/field level). <b>Option</b> - add Peatland Action data.	No, Yes for Option
What is the mix of tenures present in each business?	Provide the tenure types and areas per business (where known) based on the ARD stakeholders' analysis.	Yes
当日。		3 2

### **Data Sources and Methods**

- The analysis was a desk-based study integrating existing datasets using database and geographical information systems methods. The scope was co-constructed with RESAS analysts.
- The analysis used well-established analysis and reporting protocols so was generally low risk (see Phase 1 Report).
- Where new data needed to be brought in, the Hutton analysts made suggestions for sources, but were limited to data in the public domain and accessible without delay. The main example here was the Peatland Action mapping and payments data where only the post 2020 mapping data was available within the time frame.
- Metadata defining the sources used for the analysis was provided as part of the underpinning data shared with Scottish Government.
- Interactions with SG analysis and policy teams led to requests for more sophisticated views (maps) of the integrated data and where possible these were provided including some experimental use of bivariate mapping.
- Where better options fell outside the ability of the project to deliver then they are written up as options for further analysis.

## Caveats to the analysis - summary

Overall, this is a complex analysis that brings together many elements – there are both data quality and data integration issues that limit how the data can be used and remaining uncertainty.

Key issues are set out below but see also the Phase 1 Report Slide 10.

- Coverage Space the analysis is for businesses submitting a SAF form these are all the businesses that interact with farm payment systems – 5.7M ha of 7.8M ha total area.
- Coverage Time this is a snapshot for 2019 for the SIACS data in terms of use/management but payments for some elements of Pillar 2 are averages over the 2015-19 period. The peatland restoration data was only available to the Hutton team for 2020 onwards and only spatial data with no attribution or payments attached.
- Reliability all datasets are the best known at the time of analysis. The dataset with most potential issues is the peatland mapping.
  - **Peatland area** there is confidence that the map is not excluding deep peats (>50cm).
  - **Peatland condition** the woodland type was updated using NFI (2019) but there remains a small area of woodlands in the peatland mapping not confirmed by NFI. There would need further analysis to determine a peatland type for this area. There are questions over the area of the cropping/extensive/intensive grassland categories.

#### Granularity

- Fully spatial e.g., peat extent mapping and LCA are the most flexible datasets but have uncertainty and minimum mapping units that can mean they miss details at field scale.
- Field
  - The link by Hutton of IACS claims/payments data to field maps is imperfect, and ~120k ha are missing and this is being followed up with RPID/LPIS collages (and is likely a synchronisation issue between spatial and non-spatial elements).
  - Within field features are unmapped in the Hutton data e.g., land uses or exclusions this means uncertainty in making field to fully spatial data linkages.
  - Multiple users per field are unmapped unless a metric can meaningfully be averaged between users over the field (e.g., £ payments) then some metrics cannot be mapped at field or business or always unambiguously linked to fully spatial data (e.g., tenure).
  - Small areas recorded per field (e.g., small ha of BPS claim in otherwise unclaimed field) when mapped using the whole field area this can give the misleading impression (e.g., of large areas being paid at higher rates).
- Holding Some businesses are made up of two or more component land holdings (i.e., entities recorded as Agricultural Holdings for the JAC). These can be separated in space across Scotland or be clustered in a single locality. This granularity can be a key scale at which to assess the impacts of land management decisions such as peatland restoration as it links more closely to enterprises and specific combinations of livestock and grazing lands. The JAC and related data are collected at this level and farm type/region classifications are also available. Linkage to farm payments can though only occur at the business level without assumptions on disaggregation having to be made. Holding level analysis was out of scope.
- **Business** is the key level linking to the payment regime. The livestock and other activity data used here (with the exception of BPS activity markers) are an aggregate of holdings that may be contiguous or widely space across Scotland. This means the need for care in making inferences for businesses that draw on the mix and location of enterprises.

### Questions and links to outputs

Request	Slide / other reference								
Identify those businesses with >1000 ha of peatlands	Slide 18,19 maps of business extents and per field percentage peatlands.								
For the ~300 businesses - what kind of businesses are they?	Slide 11-13, tabular summary of the characteristics of the businesses, 13 emphasises the very wide range of business types within which large areas of peats occur.								
Are they sporting estates?	Slide 12 – driven grouse burned area small relative to business area but other sporting interests unknown, Slide 30 burning vs peatlands show only limited areas where both are present.								
Are they in the national parks?	Slide 11 – small number in both, more in CNP.								
Do they host renewable energy sources?	Slide 11 – yes (on farm) 53 of 321, others unknown.								
Do they have no agricultural activity?	Slide 20-28 – few have no agricultural activity, but many have large areas without apparent agricultural activity. Slide 27-28 linking peatlands and activity is challenging but indicative mapping possible.								
Where they are, geographically?	Slide 18/19 business maps								
Do all of them receive CAP support?	Slide 12, 31 BPS payment region,								
Are they in receipt of forestry grants?	Slide 12								
Have any undergone peatland restoration?	Slide 13, 60 businesses since 2020 PA mapping, 16 of 19k ha. Earlier unknown. Other schemes – not quantified.								
What is the mix of tenures present in each business?	Slide 11, wide variety of tenures present reflecting diversity of businesses.								
S O. F	景间《《》一选中是								

### **Tabular summary**

- A large range of characterisation options are possible based on the integrated data and can be generated in response to specific queries.
- The tables below are focused on the >1000 ha of peat per business class.

### **Distribution of Peatland**

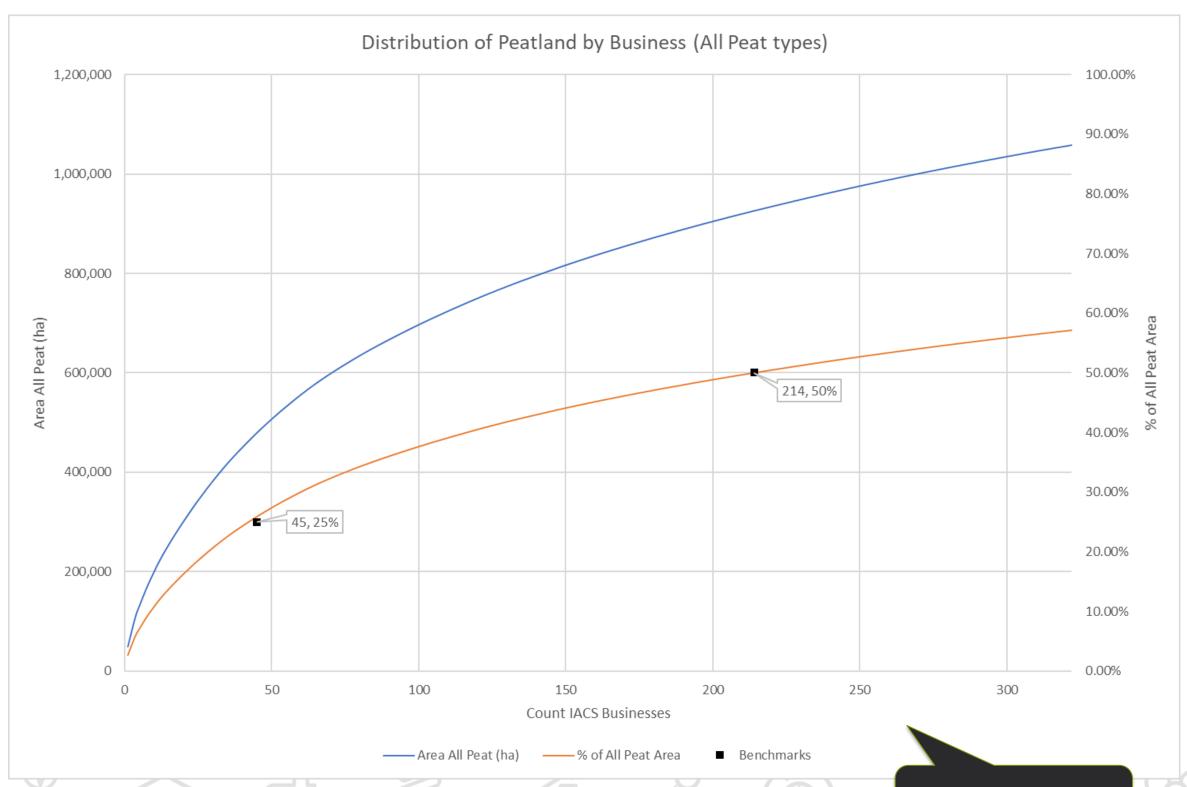

(right y axis) terms

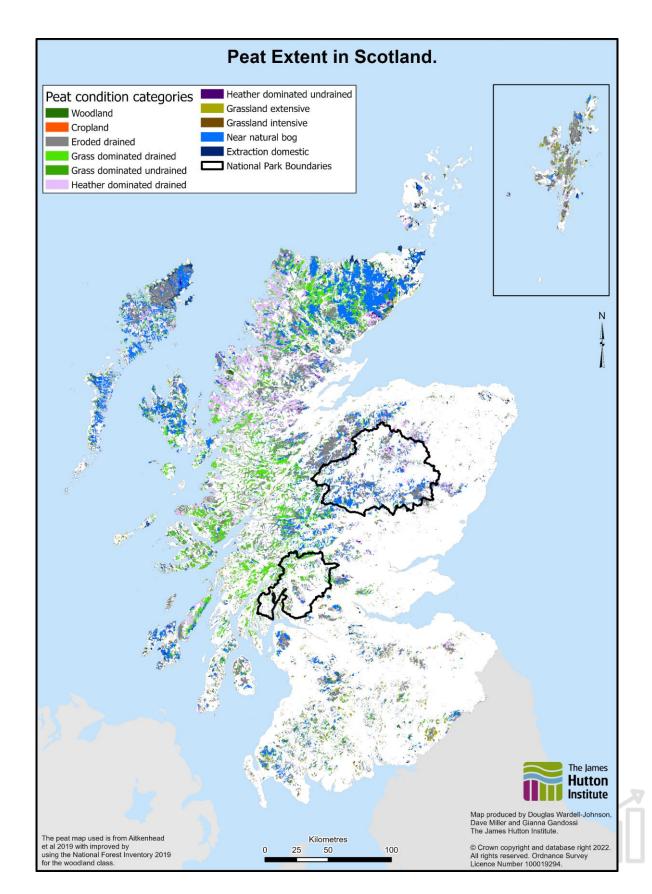

## Distribution of Peatland (top 321)

### Location of Peatlands within Scotland

- This map shows the location and classification of Peat within Scotland as defined by Aitkenhead et al 2019/21.
- Peat extent is the area where 50 cm of the top 100 cm of the soil profile is determined to be peat.
- Substantial areas of near natural bog are usually assumed not to need restoration, but this probably needs more robust verification. In any case some of these areas may be vulnerable to climate or management change and may need measures to increase their resilience to avoid the need for later restoration.

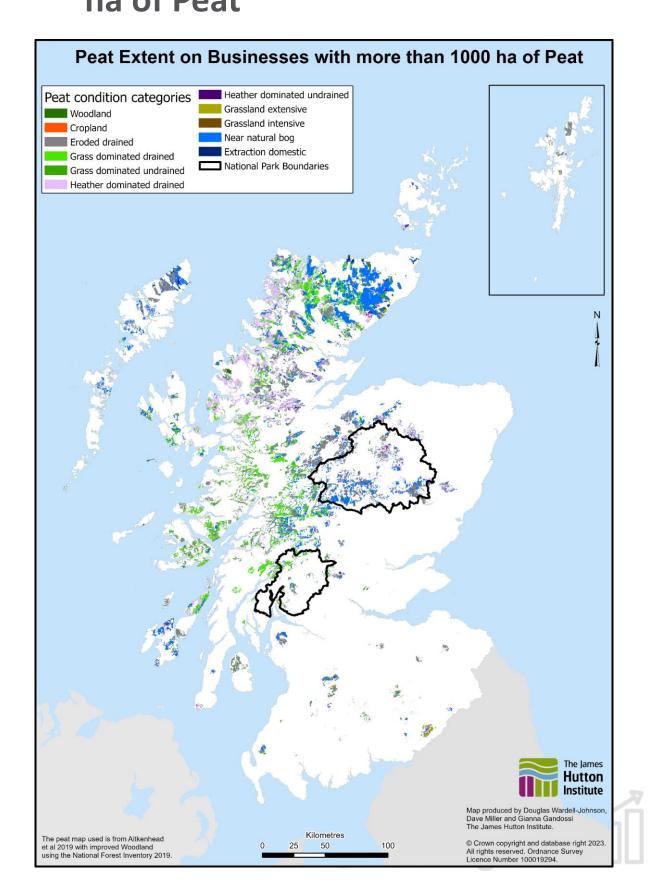

## Classification of Peatlands within Businesses with more than 1000 ha of Peat

 This map shows the extent and classification of Peatlands on fields for Businesses with more than 1000 ha of Peat.

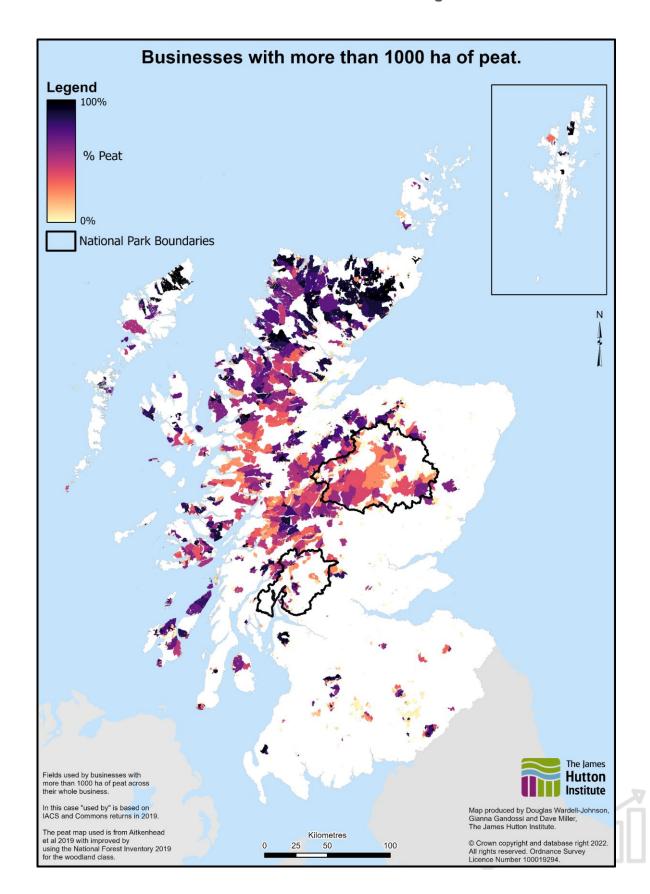

### Concentration of peatlands within businesses

- The map shows the fields of the 321 businesses with more than 1000 ha of peat, with the colour indicating the % of peat with depth >50cm within each field.
- The map gives a good indication of the concentration of peatlands across regions and within land parcels.
- The map is for all peat types so is a map of "stocks" rather than only those in need of restoration but noting the same caveats as previous slide that resilience measures may also be needed not just restoration.
- Not all fields are used by their owner so the map is of the businesses that use the fields, the distinction may potentially be important for peatland restoration where tenants may not be able to undertake works or works may be undertaken by landlords.

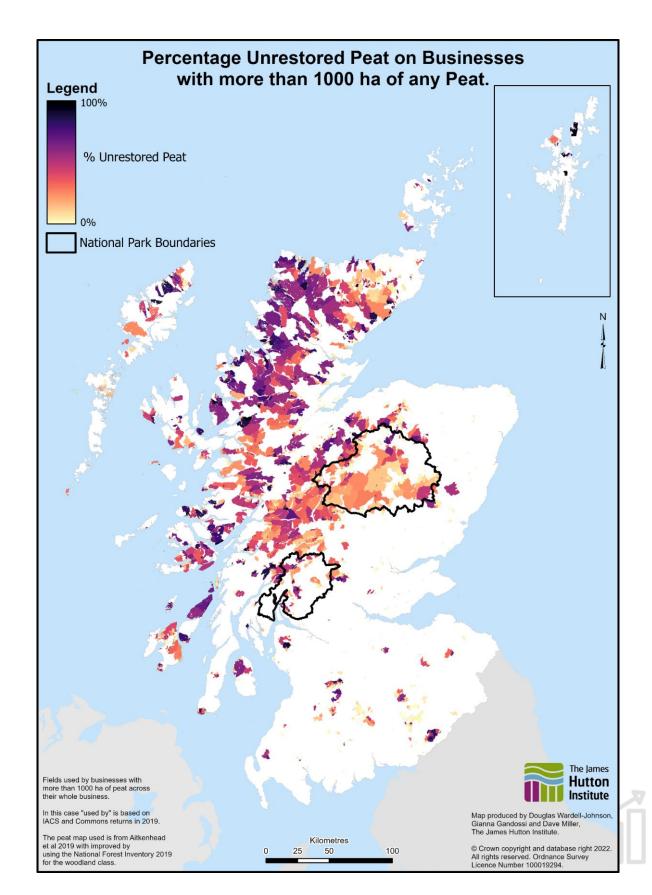

### Concentration of restoration need

- The map is the same as previous except excluding areas of near-natural bog from the calculation of percentage peat.
- Note there are few areas without some near natural bog so overall the percentage values are lower compared with Slide18.
- Higher percentages are perhaps associated with more intensive use, e.g., in coastal areas?
- There are clear differences for some locations with substantial proportions of peatlands classified as near natural bog, e.g.,
  - Caithness;
  - the north of Lewis
  - some areas of Wester Ross

### Peatlands and Farming Activity - Summary

Why this matters - potential interactions between peatland restoration and agricultural support means that knowledge is needed on which land parcels are being linked to agricultural activity.

Activity and Payment data from SG was used to define levels of agricultural activity and linkage with payments schemes (see Slide 21). Beyond these areas the types of land use was used as a proxy for activity (recognising that this leaves considerable uncertainty for some areas on the levels of activity present).

The chart opposite presents **Peatland Area versus Farming Activity** for both Near Natural Bog and the Unrestored Peatland area. The Unrestored Peatland versus Activity data is mapped on Slide 27&28.

#### **Headlines**

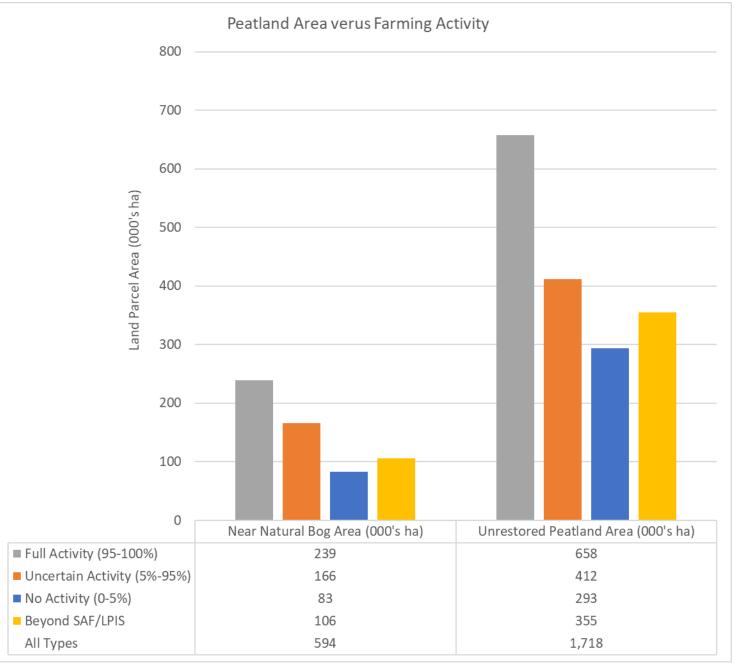

1.7M ha of peatlands are estimated to need some degree of restoration. Of this:

**658k ha** are declared as undertaking agricultural activity (38%)

**412k** ha have uncertain activity ♦ levels on peat (24%)

648k ha have either low or no agricultural activity ♦ ♦ (38%)

Across all classes 71k ha are woodlands (4%)

- ◆ Activity is the percentage of each land parcel declared active, see p25 for activity definition. Uncertainty in activity levels on peat arises when there are multiple users for the same land parcel, some active and others not (e.g., on Commons) or where only part of a land parcel is claimed in SAF so there is only partial activity data. See a map on p25 for where this occurs for all land and p27 for activity on peatlands.
- ◆ Low or no Agricultural Activity is made up of No activity (0-5%) and the Beyond SAF/LIPS class (possible farmland with unknown but likely very low activity, see p21).

## **Estimating Farming Activity - Detail**

The table presents a more detailed break down and interpretation of the data on activity in Slide 20, defining rows in the table.

- The focus of the analysis in this report is on businesses within IACS that submit a Single Application Form (SAF)

   these are all the businesses that interact with farm payment systems and have a total area of 5.7M ha (row 8).
- Beyond the SAF population there is ~2.1 M ha of land above high-water mark (comparing rows 1 and 8)
- 1. For ~1.3M ha of land beyond the SAF population (rows 2,3&4) there is no data within SIACS but from other sources there are ~0.6M ha of woodlands and ~0.35M ha of definitively non-agricultural land (inland water and urban/infrastructure), leaving ~0.35M ha of other land, as potentially utilisable agricultural area (UAA). Peatland restoration should not be limited by any farm payment regulations in this area.
- 2. For the remaining ~0.8M ha beyond the SAF population (rows 6&7) there is very limited IACS data, only mapping in the Land Parcel Identification System (LPIS), from other sources ~0.3M is woodlands with ~0.5M ha of potential UAA again for this land area peatland restoration should not be limited by any farm payment regulations.
- Within the SAF population there is a small area, 0.1M
  ha, that while submitting a SAF are not recorded as
  having any payments in 2019 (row 9, highlighted in the
  table), and are a remaining source of uncertainty in the
  analysis.

- Within the SAF population, there are **Pillar 2 only businesses**, **0.6M ha**, row 10, where peatland restoration would be less likely to conflict with agricultural activity. Of this area, only **8,000 ha** have **LFASS payments** (row 11) where agricultural activity is a factor in determining payments.
- For the other SAF businesses, receiving Direct Payments (in Pillar 1) (row 12) they have a land parcel area of ~5.0M ha, have a BPS declared area of ~3.9M ha (row 13) and Determined area of ~3.8M ha (row 14). This means that even within direct payments businesses there are large areas (>1M ha) in which peatland restoration could be undertaken without having implications for agricultural activity (see p22-26 for detail).

No.	Item	Comment	Area (N	VI	Business					
			ha)		count					
1	Land Area Scotland	Land above high water		7.8	n/a					
2	Non-LPIS woodlands	From National Forest Inventory	0.6		n/a					
3	Inland water & Urban	Incl. transport infrastructure	0.35		n/a					
4	Beyond-LPIS UAA*	= items 1-(2+3+5)	0.35		n/a					
5	LPIS polys	Mapped in LPIS		6.5	n/a					
6	LPIS woodlands	From National Forest Inventory	0.3		n/a					
7	LPIS mapped only UAA*	=items 5 – (6+8)	0.5		n/a					
8	SAF	Land parcel area – for parcels with any land use data		5.7	19,292					
9	SAF no CAP payments	Land parcel area	0.1		761					
10	Pillar 2 only	Land parcel area	0.6		1,049					
11	of which LFASS only	Land parcel area	0.008		177					
12	Direct Payments recipients (all Pillar 1)	Land parcel area		5.0	17,482					
13	BPS Declared area	Claim area - limited by entitlements		3.9						
14	BPS Determined area	Paid on area - net of reduction coefficient for RGR		3.8						
15	SAF woodlands	Land parcel area within 8	0.4							
*	Estimated from other rows									

### **SAF Claims vs LPIS Coverage**

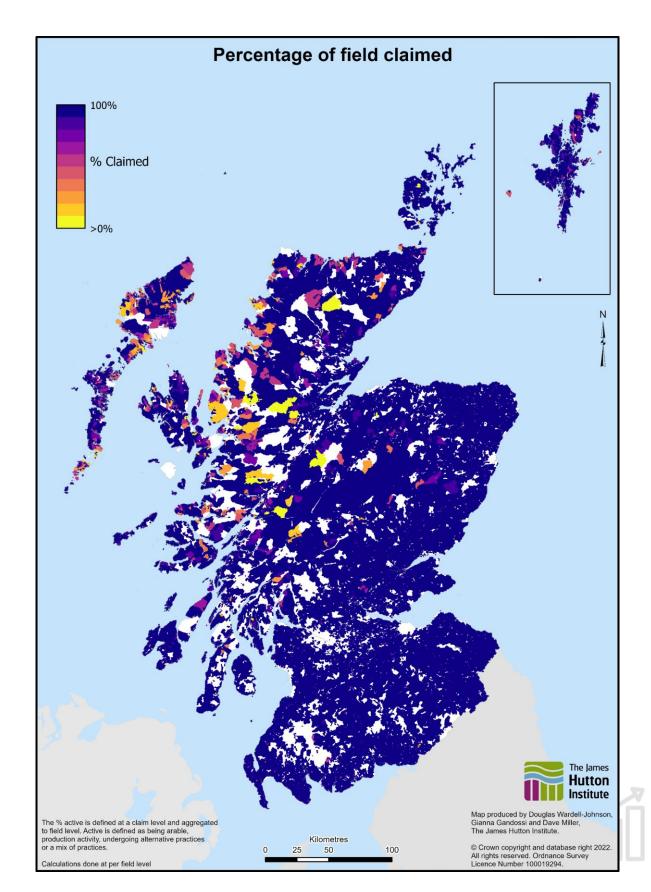

- The map on the left shows the land parcels in SAF with at least one claim in 2019 (in blue) on top of the total Land Parcel Identification Systems (LPIS) mapping coverage also for 2019 (in green).
  - LPIS captures land parcel boundaries for land at the disposal of businesses (i.e., owned or rented by them), these are used as a basis for farm payments and for managing the movement of livestock and animal disease.
- For the blue area (5.7M ha) there is land use data (in some cases only partial, see Slide 24), farm payments data (and from this indications of activity beyond land use e.g., agri-environment actions), and declarations of activity being conducted (agricultural and other types, in some cases partial and in some cases no activity is declared).
- Where the green area is visible, (0.8M ha) this shows the part of the LPIS mapping coverage where there are no claims in the 2019 SAF. For this area we have no data from SAF but can link to JAC data via the Holding-ID provided for each land parcel.
- In the green area, since there are **no claims for farm payments**, agricultural payment regulations are much less likely to have any influence of uptake of peatland restoration actions.

### Activity - Percentage of area claimed per field

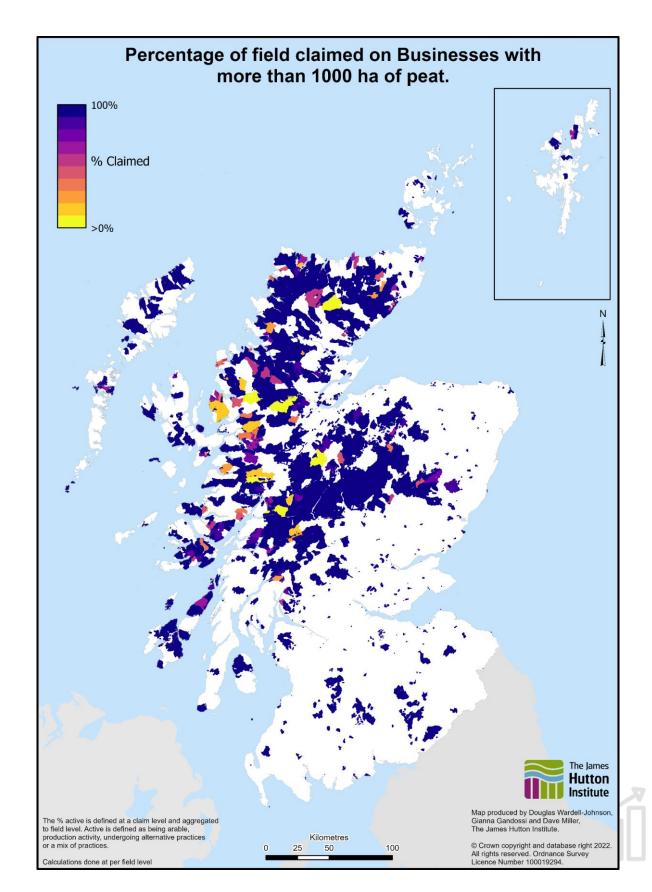

- A variety of measures are possible with differing perspectives.
- One measure of linkage to agricultural support to land parcels is the percentage of each field claimed as a basis for payments via the SAF.
- In areas with low percentages, conflicts with agricultural activity could be minimal.
- The figure presents the percentage of land parcel area claimed for all fields in which there is at least one SAF claim (5.7M ha).
- The figure shows, in much of Scotland, 100% of each land parcel is claimed in SAF, but in the north and west there are substantial numbers of land parcels in which the area claimed by SAF businesses is less than 100% of the land parcel area. This unclaimed area is estimated at ~300k ha.
- Several of these areas are peatlands and any restoration in these areas would have less potential to interact with agricultural payments.

### Activity - Percentage of area claimed per field, businesses >1000 ha of all peat

- The map opposite is the same percentage claimed for IACS per field but filtered to businesses with 1000ha or more of peat.
- Note that uncertainty on the location of SAF declared land uses within fields and the presence of multi-user fields can mean that, when less than 100% of a field is claimed, there is uncertainty in the degree of overlap between peatlands and SAF declared land uses.
- The lower percentage fields are, however, likely areas with the lowest potential for any proposed peatland restoration to be perceived as being limited by regulations associated with agricultural support.

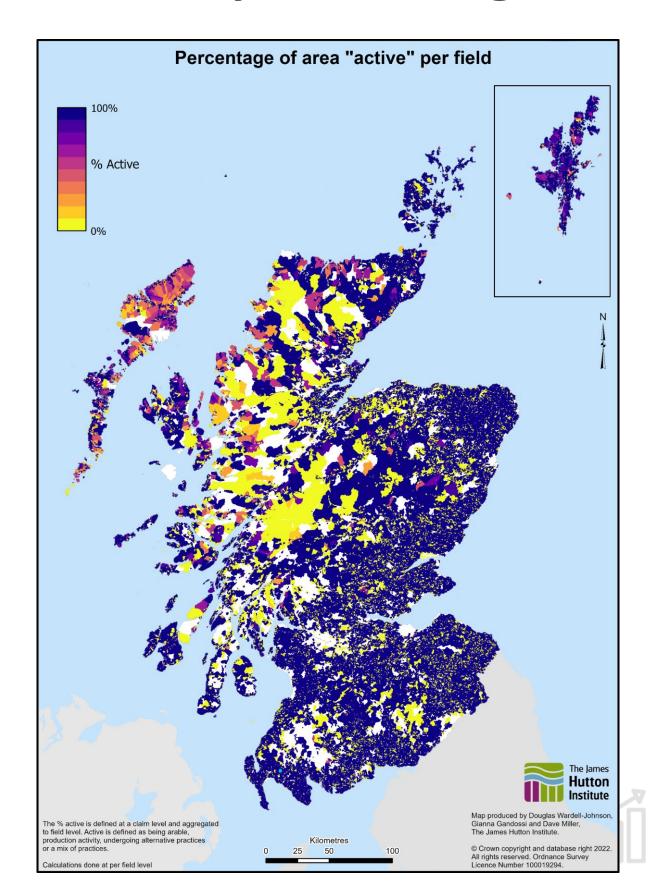

### Activity - Percentage of area active per field

- Each SAF business also classifies the activity for each land parcel they are using with the classification applying to all the land uses present.
  - The classes are Arable Cropping, Production
     Activity, Mix of Production and Alternative
     Practices, Alternative Practices, No Activity. There
     are also land parcels without activity declarations
     recorded as Null.
- Where declared as *no activity* or when the activity is *null* then there is reason to infer that in such areas agricultural activity would not interfere with peatland restoration.
- The map opposite presents the percentage of the mapped area of the fields that is declared as "active" – i.e., all classes except or no activity or null
- Compared with the previous maps (p23/24) the areas with low percentages of activity are considerably larger and include many areas where peatland restoration might occur (see p27).
- The total area of no- or null- activity is 1.2M ha across 1.4M ha of land parcels.

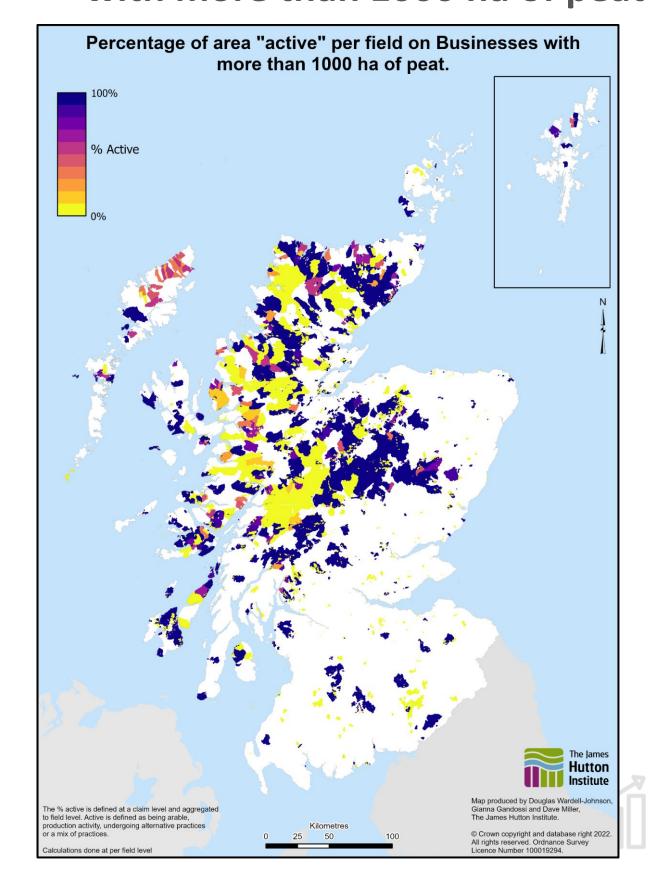

## Activity - Percentage of area active per field for businesses with more than 1000 ha of peat

- The map opposite is the same percentage classified as active for IACS per field but filtered to businesses with 1,000 ha or more of peat.
- The total area of no- or null- activity is 0.65 M ha across 0.7 M ha of land parcels.

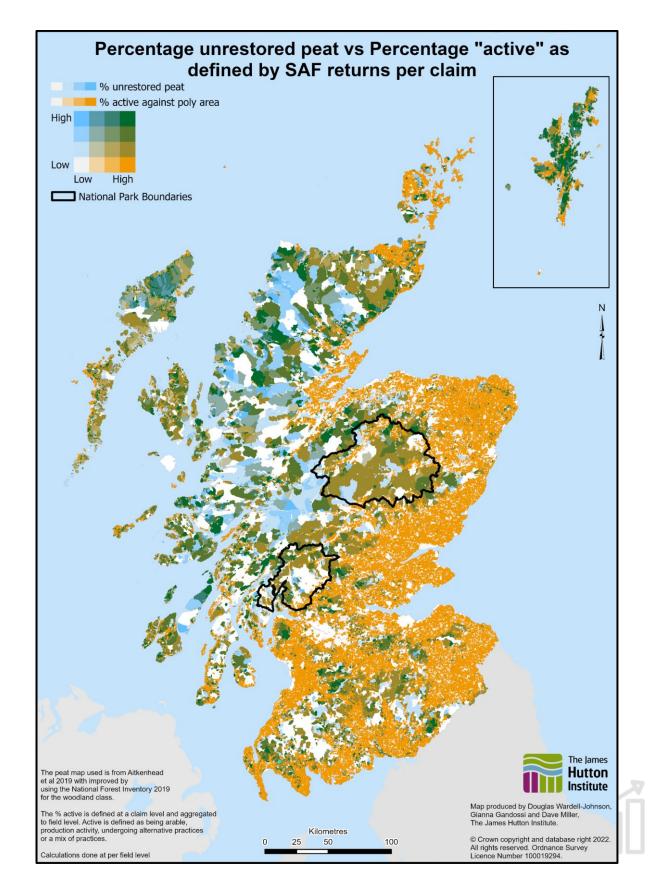

### **Activity vs Peat - Bivariate Mapping**

- The area of unrestored peat on land parcels with SAF declared Activity is as follows:
  - 293k ha on fields less than 5% active412k ha on fields between 5% and 95% active658k ha on fields greater than 95% active
- The bivariate choropleth map displays the ratios of two metrics – in this case percentage Activity per field based on SAF declarations versus percentage Unrestored Peat:
  - Green areas are areas of high activity percentage and high unrestored peat
  - Blue areas indicate areas of low activity percentages along with high levels of unrestored peat.
  - Orange areas have high activity percentages but little unrestored peat.
- This is particularly effective in differentiating land in the NW Highlands.
- The map differentiates Low-Low and High-High cases that would otherwise be mapped as the same ratio value.

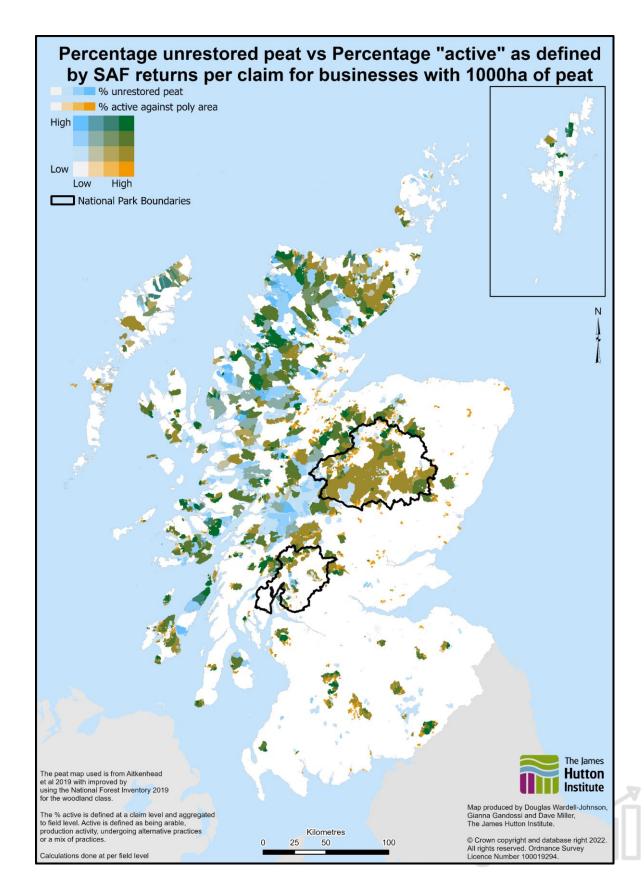

### Activity vs Peat – businesses with >1000 ha of peat

- The map opposite is the same bivariate map of activity versus unrestored peatland percentage but filtered to businesses with 1000 ha or more of peat.
- The blue areas highlight areas within the businesses with >1000 ha of peat present where there may be greatest need for restoration (% unrestored peat) and greatest opportunity (since there is limited agricultural activity (or payments) that might serve as a disincentive.

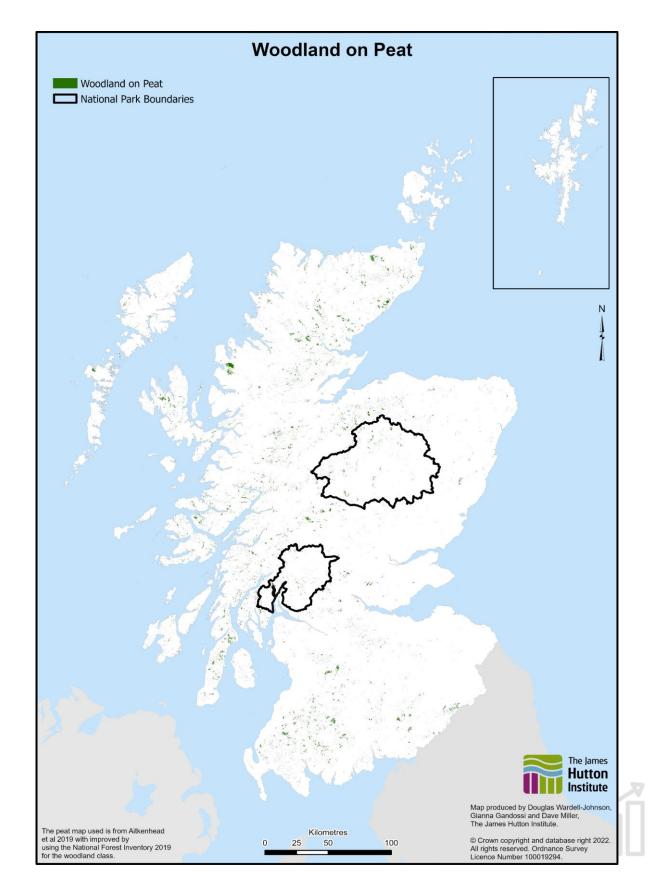

### **Woodlands on Peat**

- There are limited amounts of woodland on peat in Scotland (~71k ha with 37k ha of that on businesses with >1000 ha of peat).
- There are limited areas of extensive woodlands, and more generally small isolated stands.
- What the map does not show is where woodlands have been established on shallower peats (<50 cm) or other higher carbon soils.
- Issues in these cases are illustrated by the authors in <u>online mapping</u> and an open access journal <u>paper</u>.

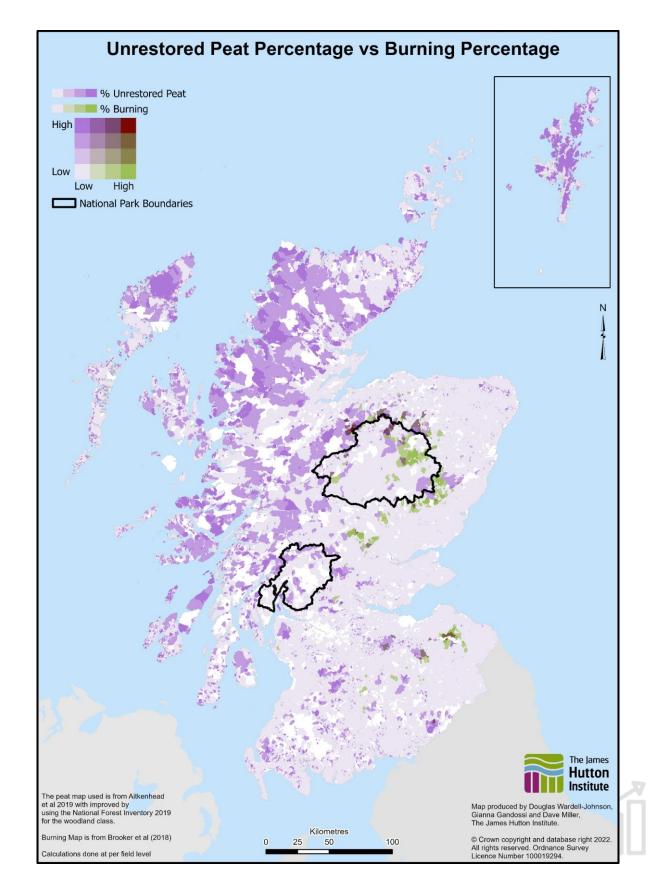

## Bivariate mapping – Peat vs Burning

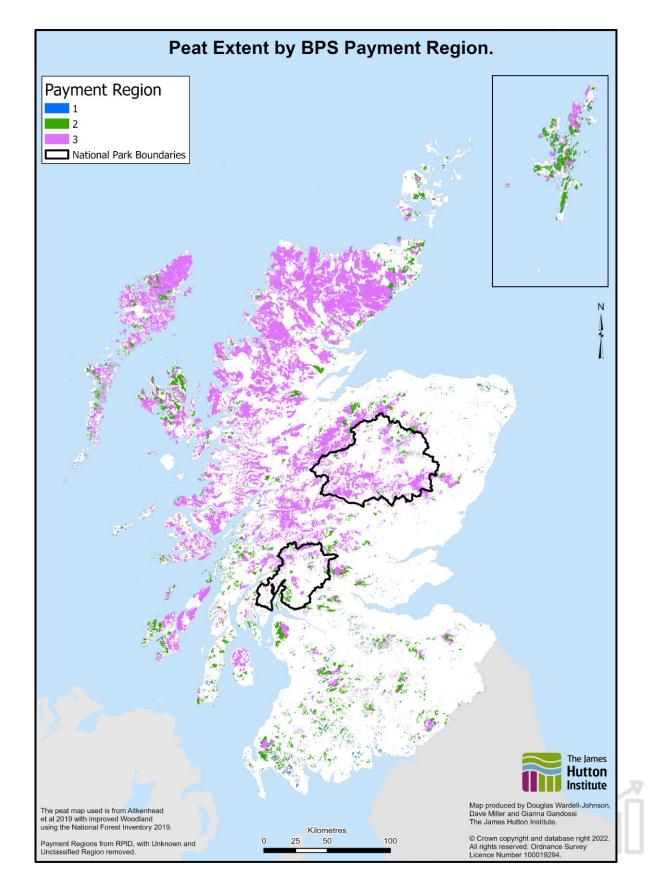

- This bivariate choropleth map displays the ratios of two metrics.
- In this example, Unrestored peat is in the Purples, % Burning for grouse is in the Greens.
- The intersection of these produces browns and reds showing areas where there are high values of both variables.
- The bivariate map distinguishes where higher burning % and higher proportions of unrestored peat occur from low amount of burning and low amount of peat that would otherwise be mapped the same ratio.
- There are few areas of high values in both, the Pentlands and northern edge of the Cairngorms NP are the exceptions
- If peatlands were defined a >30cm there overlap would likely be larger.

## Peat by Basic Payment Scheme Region

- The BPS Payment Regions give an indication of the level of support per ha available.
- Most of the peat area in Scotland is in Region 3 (~1.48M ha).
- Region 3 has the lowest level of direct support.
- Region 3 and 2 were rough grazing when the regions were defined with Region 2 differentiated by having higher stocking rates (in LFASS).
- Region 1 gets higher levels of support and included cropland and permanent grassland when the regions were defined.
- There is a small amount of Region 1 peatlands (54k ha) with little of this being in businesses with over 1000 ha of peat.
- This map should not be used as a direct proxy for overall levels of support since it doesn't show all payments e.g., Pillar 1 VCS or Pillar 2 LFASS. The map does show what the implications might be for loss of BPS eligibility, but see earlier slides for caveats linked to the presence of unclaimed areas within businesses.

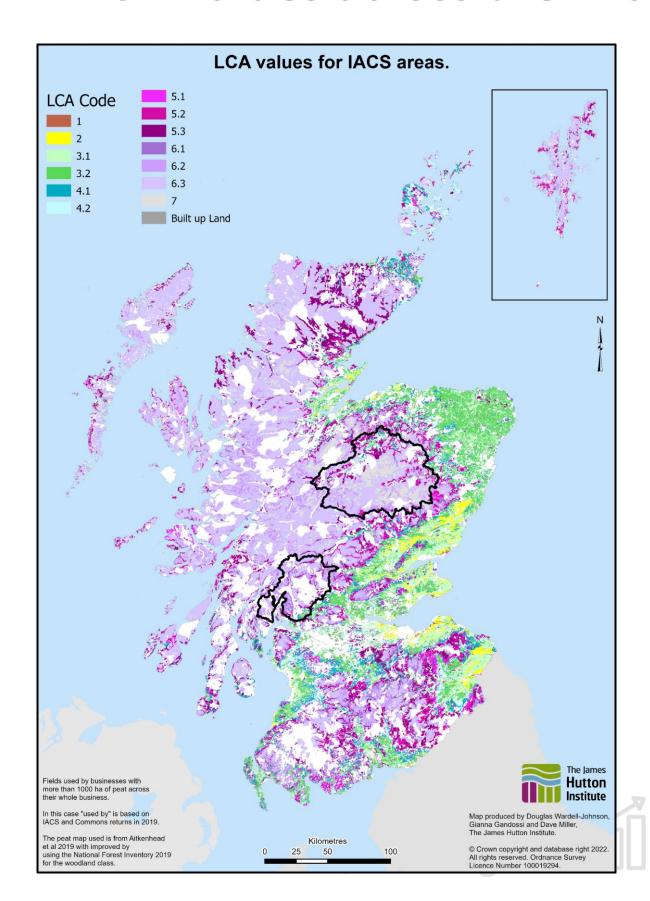

### LCA Values across the IACS areas of Scotland

- Land Capability for Agriculture (LCA) presents the range of agricultural activities that can typically be undertaken.
- The map presents the LCA for all the land mapped within IACS for 2019.
- Higher LCA classes tend to have more limited potential and are less productive per ha, though links with land use are complex and localised.
- Significant areas of the LCA class 6.x and above are not used for agriculture.
- The available LCA mapping has several limitations – but the main one being the climatic component is based on 1958-78 data.
- The LCA is being updated by Hutton staff (in 2023).

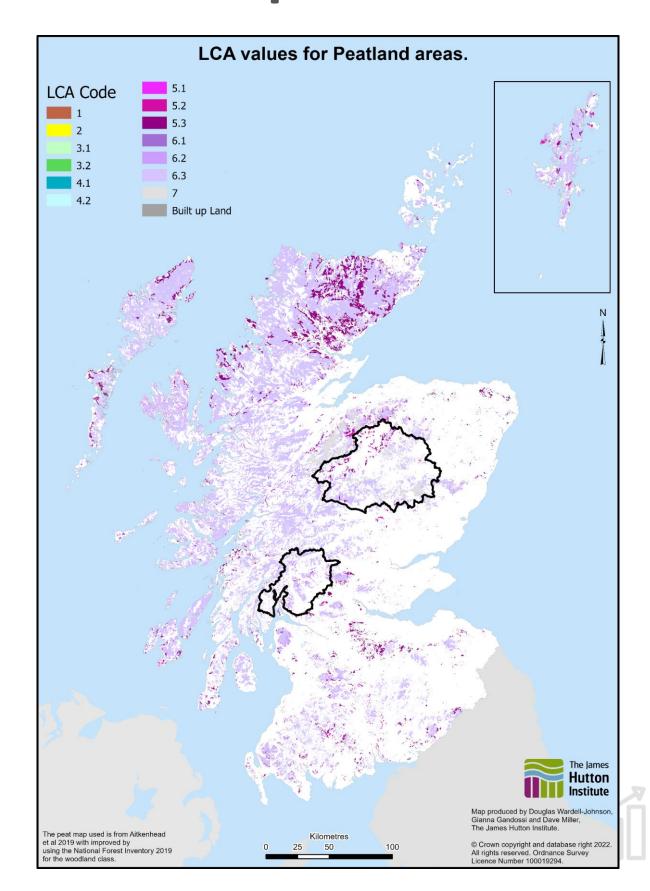

### LCA of peatlands

- The map opposite shows the LCA of peatlands.
- This is dominated by LCA class 6 and above.
- Lower numbered classes, where present, are likely an artefact of differences in the area defined as peats in the Peatland Extent and LCA maps (the latter using being the 1:250,000 scale soils mapping).

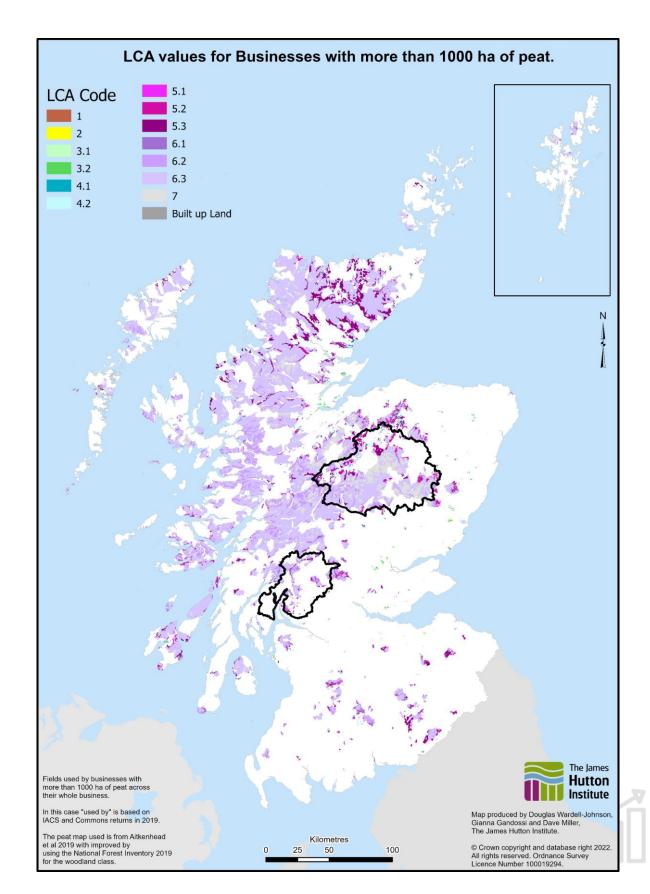

### LCA Values for businesses with 1000ha of Peat

- The map opposite is the Land Capability for Agriculture (LCA) mix for businesses with 1,000 ha or more of peat.
- This is dominated by LCA class 5 (214k ha) and 6 (1,500k ha) with limited or very limited agricultural potential.
- The scale of mapping does however hide that these businesses also have at their disposal ~44k ha of LCA1-4.2 land often in associated lowland holdings.
